**Rectification**

In the KNGF Guideline Stroke Motor a mistake was made in the description of **learning principles (paragraph B.5)**.

It said: Procedural learning of movements that are normally performed automatically should focus on *the performance of the movement*, while declarative learning should focus on *the results of the action*.

Whereas it should be the other way around:
Procedural learning of movements that are normally performed automatically should focus on **the results of the action**, while declarative learning should focus on **the performance of the movement**.

Present pdf is correct.
